Project Overview

This project focuses on developing a 4 dual-band Yagi antenna array to enhance satellite communication capabilities for Texas State University. In collaboration with the Physics Department's "Space Lab", it will be designed

- > Provide dual-band functionality
- > Provide higher gain than single antennas
- > Offer Texas State University students with the opportunity to communicate with satellites and develop their own satellite

Features and Requirements

Features

- > A gain increase over Arrow Antenna's 146/437 dual band Yagi
- > Ability to uplink on the 2m band and downlink on the 70cm band
- Lightweight and sturdy construction
- > Gamma matching for fine tuning impedance

Requirements

- > Gain must be greater than individual antenna
- ➤ Weight must be under 40lbs

D2 Results

- > Successfully demonstrate functionality at the 2m and 70cm bands
- > Achieved an increase over the single dual band Yagi 2m: 5dB increase 70cm:
- > Correctly phased and spaced array for optimal results
- > Effectively tested system with Yaesu FT-7900r

Meet the Team

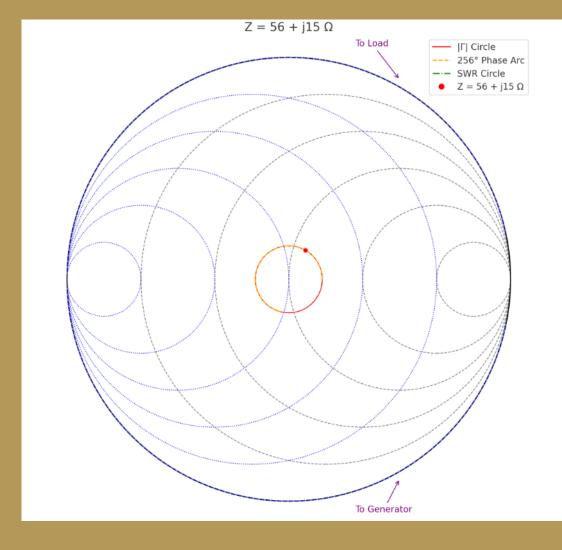

Miguel Montes, Alec Prescott, Miguel Trujillo, Carson Harville

Phasing System

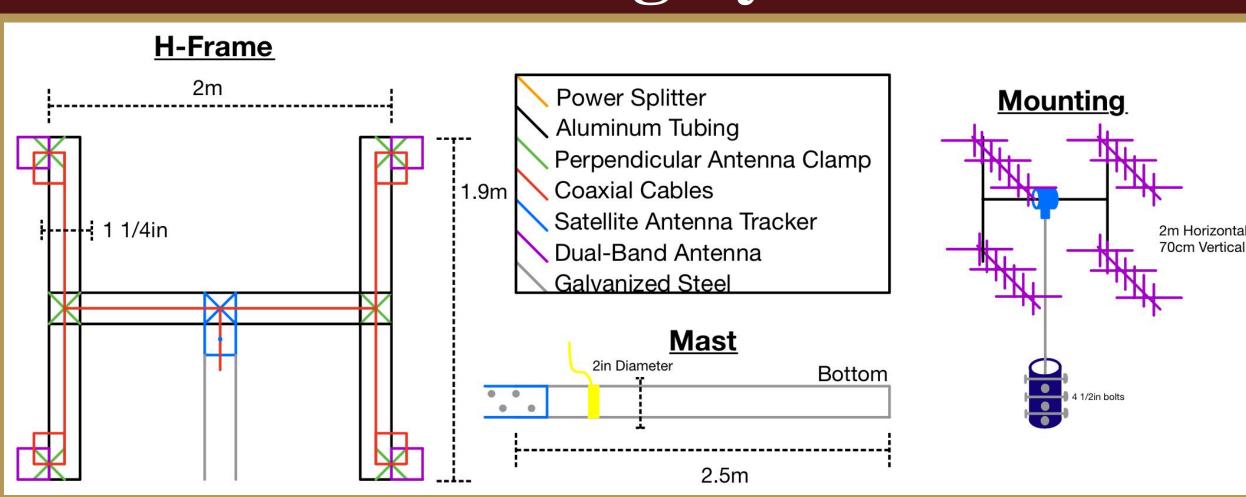

> 2 m band will use 3 quarterwavelengths of cable for 270degree phasing. Actual: 243 degrees

> 70 cm band will use 7 quarterwavelengths of cable for 270 degrees of phasing. Actual: 256 degrees

Mounting System

- 90-Degree Polarization = ~60db Isolation
- Beamwidth/Main lobe tighter
- Side lobes significantly suppressed
